

### 2 Conditions for orthogonal

- ↳ Neutral
- ↳ Mutual exclusive terms

\* K-MAP (Karnaugh Map) L-20

- Boolean variable → symbol which can take value 0 or 1

Ex  $n \rightarrow 0$   
 $n \rightarrow 1$

- Literal → use of variable or its complement in an expression

$$f(x, y) = \frac{\bar{x}y + x\bar{y}}{2}$$

2 variables

4 Literals

\* Implement the following function

$$f(x, y, z) = \bar{x}yz + xyz$$

2 AND gate (3 I/P)  
 1 OR gate  
 1 Not gate

\* Another way to implement:-

• Minimization

$$f(x, y, z) = \bar{x} y z + x y z$$

$$y z (x + \bar{x})$$

↓ complement law

$$y z (1)$$

$$y z$$

There are two way to minimize an expression

- 1) Boolean laws
- 2) ~~karna~~ Karnaugh Map

Summary :-

→ before implementing the function by logic gates we must first minimize it

→ for minimization we can apply boolean laws on identities. But some time its difficult to minimize expression by laws like:

$$f(A, B, C) = AB + \bar{A}C + BC$$

↓  $1 \cdot BC$  (crucial step)  
identity law

$$AB + \bar{A}C + (A + \bar{A}) \cdot BC$$

$$\underline{AB} + \bar{A}C + \underline{ABC} + \bar{A}BC$$

$$AB + \bar{A}C$$

Hence better option is Karnaugh Map.

# K-Map

- Application of venn diagram based on gray code
- Minimum possible 1 var 8 max for n variable
- for "n" var boolean f<sup>n</sup> we've to make  $2^n$  minterms & for each minterm we have cell in K-Map
- Hence Total no. of cells =  $2^n$  (for n variable)

4 var k map has no. of cells  $\Rightarrow 2^4 = 16$

$f(A,B,C,D) = \sum m(0, 1, 13, 15)$
